Internet Application Programming
Lab1

In the query above, what is the meaning of AUTO_INCREMENT and NOT NULL?
Auto_Increment-allows the database to increment the value of the specified row by one when a new record is inserted into a table
Not null-ensures the column does not insert null values

Identify any SQL constraints in the query you just executed.
1. **Not null**
2. **Primary Key**

What does the function save() return;
The data fetched from the database.

Try to delete the function readAll() from User class, run the program and make your observation.
The action results in a fatal error

Explain what is happening in line 18-21 in the file lab1.php
The if statement is used to check whether the data required from the query($res) was saved to the database.if successful,the program outputs "save operation was successful".else ,the program outputs "An error occurred"
